ONCO-DELTA: Phase II Trial of Onkatinib in EGFR-Mutant NSCLC

SYNTHETIC DEMONSTRATION DATA. This document is fictional and was generated for testing a document retrieval system. It contains no real patient information and does not report genuine research findings. Do not use it for clinical decisions.

Document ID	MDA-CT-008
Sponsor	Northbridge Clinical Research Unit (fictional)
Document type	Clinical trial summary
Study identifier	ONCO-DELTA (NB-ONC-2107)
Investigational product	Onkatinib (fictional tyrosine kinase inhibitor), 150 mg daily
Report date	2025-06-18

Background

Onkatinib is a fictional third-generation EGFR tyrosine kinase inhibitor for previously treated non-small cell lung cancer (NSCLC).

Cohort and methods

Single-arm study of 128 patients with EGFR-mutant advanced NSCLC who progressed after one prior TKI. Median age was 63 years; 22% had stable brain metastases. The primary endpoint was objective response rate (ORR) by RECIST 1.1.

Results

ORR was 38% (49/128; 95% CI 30 to 47). Median duration of response was 8.3 months. Median progression-free survival (PFS) was 9.6 months and the disease control rate was 81%. Intracranial ORR among patients with brain metastases was 32%.

Safety

Grade 3 or higher treatment-related adverse events occurred in 27% of patients, including rash (8%), diarrhea (6%) and ALT elevation (4.2%). Dose reductions were needed in 19% of patients.

Summary table

Efficacy endpoint	Result (n=128)
Objective response rate	38%
Median progression-free survival	9.6 months
Median duration of response	8.3 months
Disease control rate	81%
